

## Cancer incidence, by type of cancer

<b>Abbreviated name</b>	Cancer incidence, by type of cancer
<b>Indicator name</b>	Cancer incidence rate, by type of cancer (per 100 000 population)
<b>Domain</b>	Health status
<b>Subdomain</b>	NCDs and nutrition
<b>Associated terms</b>	Morbidity
<b>Definition</b>	Number of new cancers of a specific site/type occurring per 100 000 population.
<b>Numerator</b>	Number of new cancer cases diagnosed in a specific year. This may include multiple primary cancers occurring in one patient. The primary site reported is the site of origin and not the metastatic site. In general, the incidence rate would not include recurrences.
<b>Denominator</b>	The at-risk population for the given category of cancer. The population used depends on the rate to be calculated. For cancer sites that occur only in one sex, the sex-specific population (e.g. females for cervical cancer) is used.
<b>Disaggregation/ additional dimension</b>	Type (leading cancers) – e.g. breast, cervix, colon, liver, lung, prostate, stomach Age, place of residence, sex, socioeconomic status
<b>Method of measurement</b>	Cancer registries.
<b>Method of estimation</b>	$(\text{Number of new cancer cases diagnosed in a specific year}) / (\text{at-risk population for that category}) \times 100\,000$ . If cancer registries are incomplete, adjustments need to be made.
<b>Measurement frequency</b>	Annual
<b>Monitoring and evaluation framework</b>	Impact
<b>Preferred data sources</b>	Population-based cancer registries which collect and classify information on all new cases of cancer in a defined population
<b>Other possible data sources</b>
