

PLOS

PLOS has a robust [data availability policy](#) that mandates that all data necessary to replicate a study's findings be made publicly available without restriction at the time of publication. We fully support the sharing of health data to facilitate reproducibility, transparency and trust in research, and enable patients, clinicians and policymakers to have access to data that they need to improve health outcomes worldwide.

However, data must be shared within the appropriate ethical and legal frameworks to protect participant privacy. PLOS works closely with authors, reviewers and our Editorial Board to ensure that health data are shared in accordance with our policy. In cases where data cannot be shared for ethical or legal reasons, we ask authors to explain the restrictions in detail (for example, data are potentially identifying, or the participants did not consent to having their health data shared) and to provide contact information for a relevant data access committee or ethics committee.
